AI Tool Prompt Engineering Report

AI Tool Overview

The AI tool to be used in this laboratory activity is **GPT Image 1.5**. This falls under the generative media domain, which comprises AI tools that enable users to input their own prompts to generate images, videos, etc. I selected this tool because I used it in the past semester, when I generated sample images for my website project in a major subject. It produced high-quality images and is reliable.

Original Prompt

The original prompt I constructed is: *"Generate me a muscle-class car with a black and red livery and place it in a singular car showroom with dim surroundings and a white downlighting".*

AI-Assisted Prompt

I used Gemini to reconstruct the original prompt. This is the improved version: *"Low-angle cinematic shot of a vintage-inspired muscle car, matte black finish with blood-red accents. The car is parked in a pitch-black void showroom. A solitary bright white spotlight shines directly down from above, carving the car out of the shadows. Visible tire tread, carbon fiber details, moody atmosphere, heavy contrast, shot on 35mm lens".*

Comparison Analysis

With the original version, it seems like the image is professionally taken for let's say a sale, it looks natural and not forced to be dramatic. In the "improved" version, the image depicts the car as if it were from a fiction film, like a sci-fi one. It even changed subtle things about the car, the headlights are red, the paint is now matte and now shiny, the body kit is wider, and the car is lowered. The surroundings are also different; the background has changed from a garage to just pitch black emptiness, and the down lighting is smaller. The camera angle is also lower than the original version. In my opinion, the original version is more useful and favors my liking. The "improved" version is too dramatic in my eyes, and it could be deemed more effective if the context matches. The improved prompt affected clarity slightly; it made sure to maintain the same model of the car but made subtle changes in its appearance. For depth, I suppose it helped in placing more emphasis on the dramatic aspect of the construction of the image; the background changed to put more focus on the subject. For relevance, I believe the improved version did not stray away from the original prompt; it just made sure to improve the quality of the image. I suppose the improved prompt went deeper to describe the creation of the image, the description of the details on the car, the description of the surroundings, and the framing of the image. What I learned about prompt engineering is that selecting the correct words to describe what kind of results you want the tool to generate matters the most; even the slightest change in words can alter the result, but also having way too many words may stray the output away from your desired result. In conclusion, choose your words wisely when it comes to generating the media you want from these AI tools.
