***One-Page Website Creation & Deployment Using
Replit***

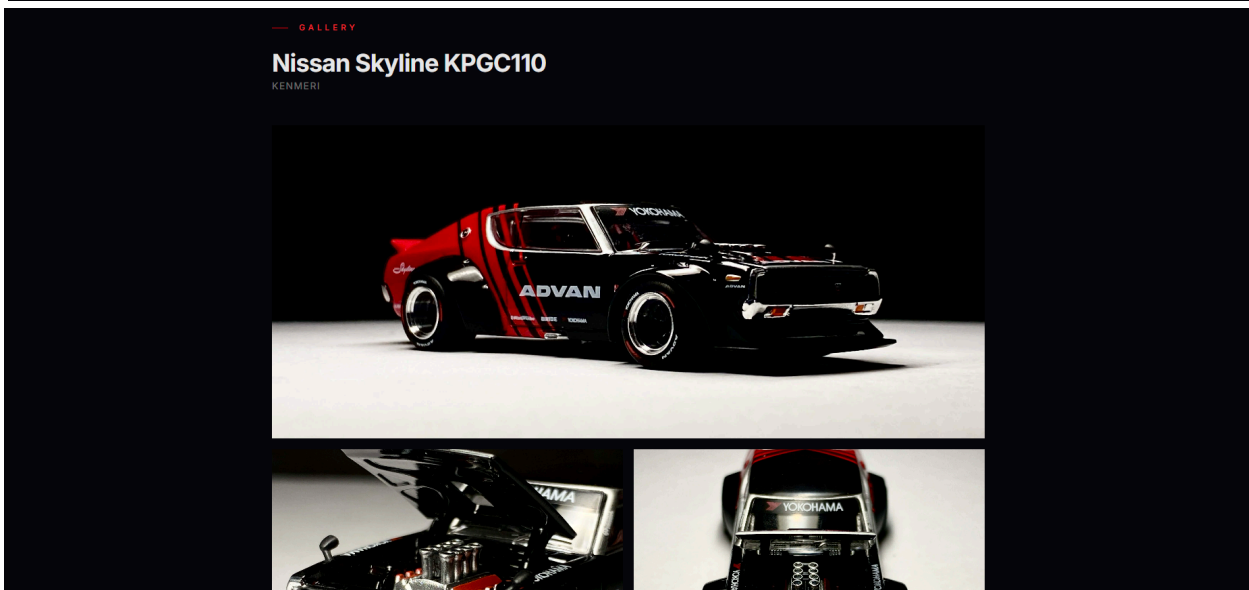

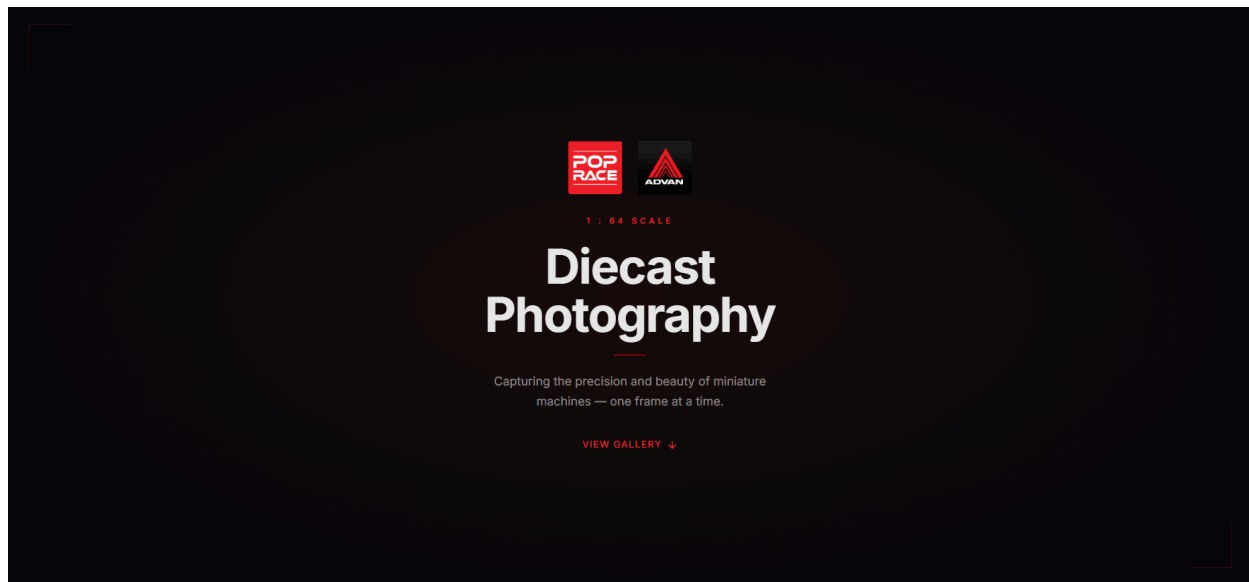

Initial Prompt

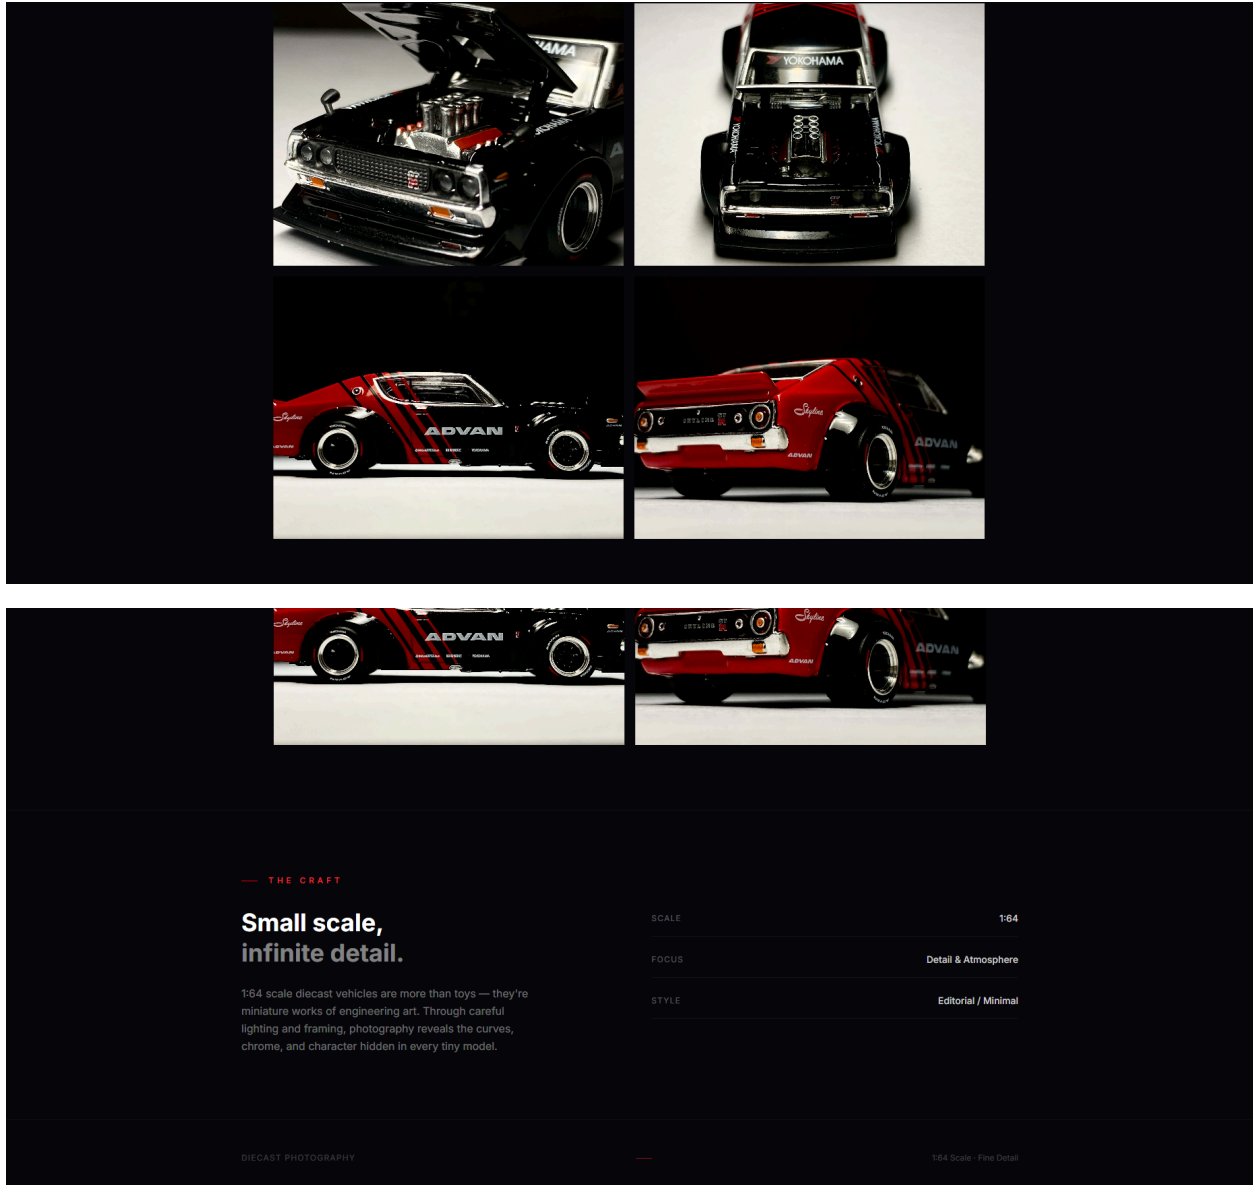

The original prompt I used for the foundation is: *“Create a one page scrollable website to display my passion which is taking photos of 1:64 diecast vehicles. I like this exact one car and I want to display 5 photos of it. Make a minimal design with a black and red color scheme”*.

Refinement Prompts

- *“include this logo to be shown around the top middle part of the page”*
- *“arrange the photos like this: 5th to 1st, 1st to 3rd, 3rd to 5th”*
- *“place this advan logo beside the pop race one”*
- *“would you please remove the red text color in the word diecast”*
- *“sorry i mean now match the text color of the word diecast with photography, photography text color is better”*
- *“can we make the view gallery button scroll slowly down to the images instead of just taking it directly down”*
- *“in the gallery part, include the name of the car, which is Nissan Skyline KPGC110 (Kenmeri)”*

Screenshots of the Output

Final Reflection

Replit was easy to work with, I wrote such a short initial prompt yet it aligned to what I imagined. It had the minimal visual I wanted, and it knows where to place the appropriate elements like the logos, and how to place the photos I uploaded. What needed manual fixing were some of the text colors, the arrangement of the photos, and some animations which the initial prompt lacked. What I learned about prompting is that no matter how short your prompt is, as long as the information is sufficient, these next-level AI tools can still make something out of it, if I were more detailed in prompting, I may have had the tool produce a better result.
